在现实世界中，空气中充满了微小的粒子（灰尘，水蒸气等），这些粒子都会跟光产生交互（吸收，散射等），从而产生一些不一样的光学现象。

而在游戏渲染中，如果没有特殊处理，则我们看到的渲染结果，其实是相当于把空间当成真空，没有任何介质干扰光的传播而得到的结果，这个结果只考虑了物体表面着色。

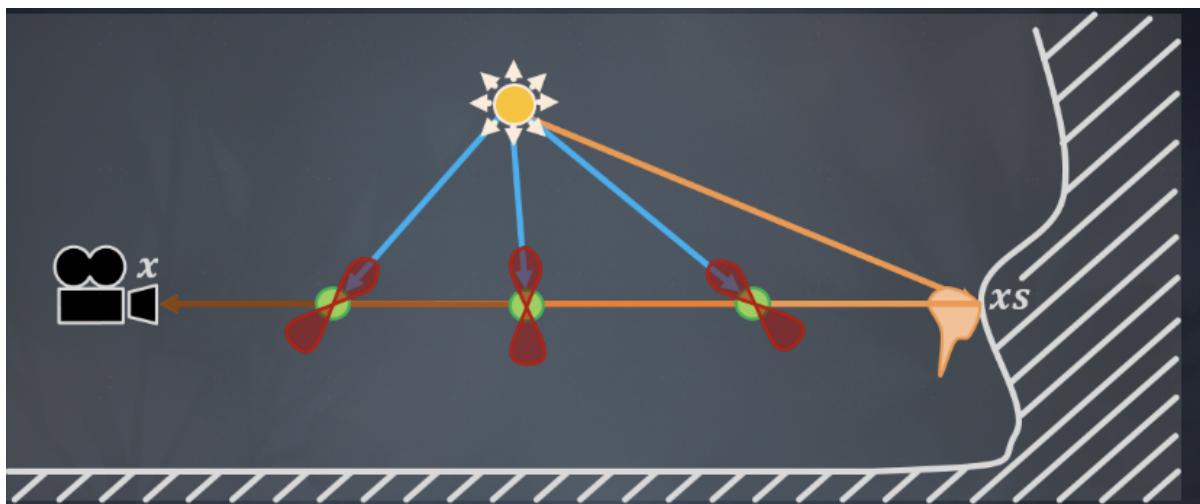

当考虑了空气介质对于光传播的影响后，效果如下

我们在这里先考虑某一个着色点

如下图，实际上考虑空气介质的影响，我们需要考虑到光线传播过程中和空气中粒子的“反应”

然而由于算力的限制，实际渲染无法做到真实的粒子模拟，因此常规的做法是在传输路径上进行微分。如上图，假如只考虑路径上三个点，则最终摄像机接收到的着色结果为 xs 着色点的表面着色结果，依次计算经过每个点的结果，进行累加。

对于每个点，需要同时考虑外部光源（环境光，间接光，直接光等）的影响，如上图蓝色射线所示，对于入射的光，有一定概率会因为散射正好散射到观察方向，下文我们将通过一个描述函数来描述这个概率。

当然，如果点位划分更多，则结果会更精确，当划分无限多时，则近似于现实中的结果。

在渲染中，常见的做法是RayMarching和体素化的方式去模拟对光线传播路径的积分。

参数部分

吸收系数

$$\sigma_a$$

光穿过单位距离时被吸收的概率

外散射系数

$$\sigma_s$$

光穿过单位距离时外散射的概率

总衰减系数 (单位: /m)

$$\sigma_t = \sigma_a + \sigma_s$$

平均自由程/mean free path

$$\rho = \frac{1}{\sigma_t}$$

反照率albedo

$$\rho = \frac{\sigma_s}{\sigma_t}$$

表现为介质外观颜色属性

Beer-Lambert law

描述两点之间光线的透光率

当介质内部完全均匀时

$$T_r(p \rightarrow p') = e^{-\sigma_t d}$$

当介质内部不均匀时

$$T_r(p \rightarrow p') = e^{-\int_0^d \sigma_t(p + t\omega, \omega) dt}$$

相函数

描述发生散射之后，散射方向的分布情况。

在各向同性完全均匀的介质中，散射方向分布也是均匀的，为单位球体总立体角的倒数

$$p(\omega_i, \omega_o) = \frac{1}{4\pi}$$

米氏散射

当微粒半径的大小**接近于或者大于**入射光线的波长 λ 的时候，大部分的入射光线会沿着**前进**的方向进行散射，这种现象被称为**米氏散射**。这种大微粒包括灰尘，水滴，来自污染物的颗粒物质，如烟雾等。

瑞利散射

瑞利散射是一种对应于颗粒尺寸远小于光波长的散射现象。[波长较短的蓝光](#)比波长较长的[红光](#)更易产生瑞利散射。

$$P(\cos\theta) = \frac{3}{4} \frac{(1 + \cos^2\theta)}{\lambda^4}$$

Henyey-Greenstein相函数

当各项异性时，常用Henyey-Greenstein相函数来描述

$$P_{HG}(\cos\theta) = \frac{1}{4\pi} \frac{1 - g^2}{(1 + g^2 + 2g(\cos\theta))^{\frac{3}{2}}}$$

其中 g 为非对称参数，取值范围 $[-1, 1]$ ，当 $g < 0$ ，代表光更倾向于发生背散射，当 $g > 0$ ，则代表光更倾向于发生前散射。

Cornette-Shanks相函数

CS相函数是对于HG相函数的修正，在云的渲染上提供了更加符合物理的描述。

基础版公式为

$$P_{cs}(\cos\theta) = \frac{3}{2} \frac{(1-g^2)}{(2+g^2)} \frac{(1+\cos^2\theta)}{(1+g^2-2g\cos\theta)^{\frac{3}{2}}}$$

对于云雾的渲染，主要关注前向散射部分，因此可以对公式进行简化

改进版公式为

$$P(\cos\theta) = \frac{3}{2} \frac{(1-g^2)}{(2+g^2)} \frac{(1+\cos^2\theta)}{(1+g^2-2g\cos\theta)} + g\cos\theta$$

下图是关于相函数的相关介绍

3.2 Common Phase Functions

Rayleigh phase function. As shown in formula (9), Rayleigh phase function is applicable to the case of Rayleigh scattering, which requires particle size is much smaller than the wavelength λ of incident light. Rayleigh phase function is simple and fast, but not close to the cloud optical properties. It was used in [19] and yielded good results. But there were some bright spots in some clouds shown as Fig. 5(a).

$$P(\phi) = \frac{3}{4} \frac{(1+\cos^2\theta)}{\lambda^4} \quad (9)$$

Henyey-Greenstein phase function. It described the scattering of radiation in the galaxy firstly [27]. It is useful in scattering calculation of biological organs, water, clouds and many other natural materials, and is an approximation of Mie scattering, expressed as formula (10).

$$P_{HG}(\phi) = \frac{1}{4\pi} \frac{1-g^2}{(1+g^2-2g\cos\phi)^{3/2}} \quad (10)$$

where g is asymmetric factor, controlling the redistribution shapes of the scattered lights.

Cornette-Shanks phase function. Cornette and Shanks amended Henyey-Greenstein phase function and gave a more physically reasonable representation for clouds illumination expressed as formula (11). It was used in [28] while drawing cloud scenes.

$$P_{CS}(\phi) = \frac{3}{2} \frac{(1-g^2)}{(2+g^2)} \frac{(1+\cos^2\theta)}{(1+g^2-2g\cos\theta)^{3/2}} \quad (11)$$

3.3 Improved Phase Function

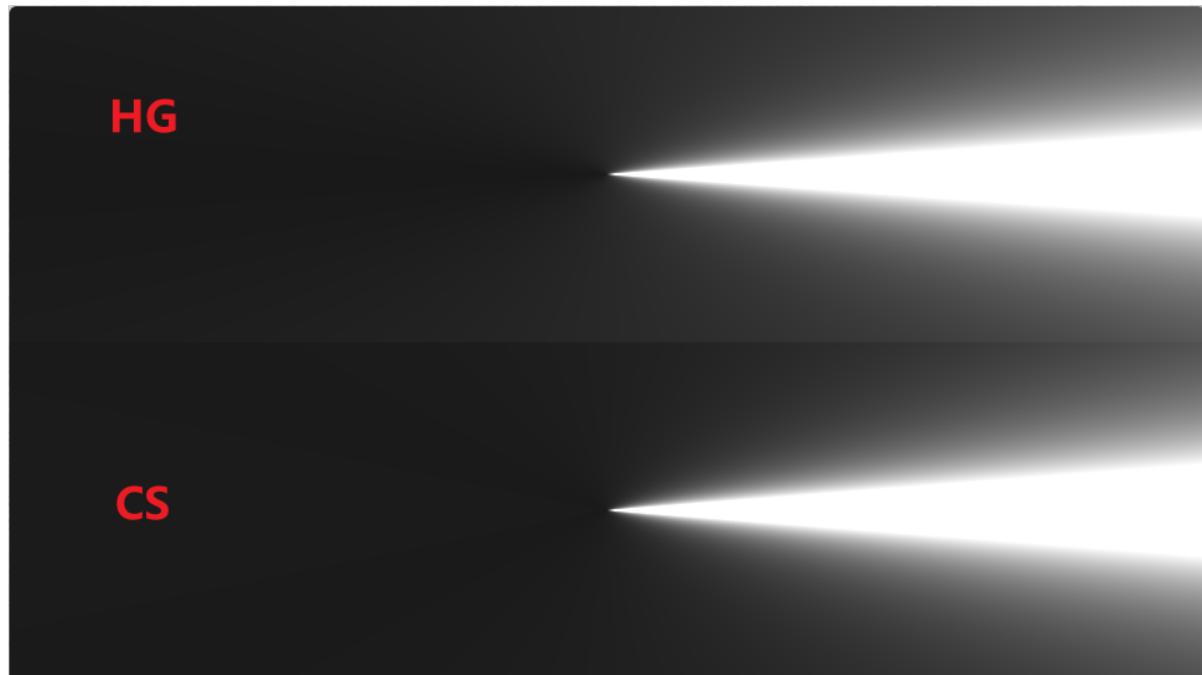

It can be seen that exponential computations are needed in Henyey-Greenstein and Cornette-Shanks phase functions, which make the computation time greatly improved. Rayleigh phase function is simple, but it is not suitable for the illumination computation of clouds. To solve these problems, improved phase function is proposed based on Cornette-Shanks phase function.

As the scattering of cloud particles focuses on the forward scattering, the exponential item in formula (11) is simplified, and another adjustment item is added. We can get the following simplified phase function defined as formula (12).

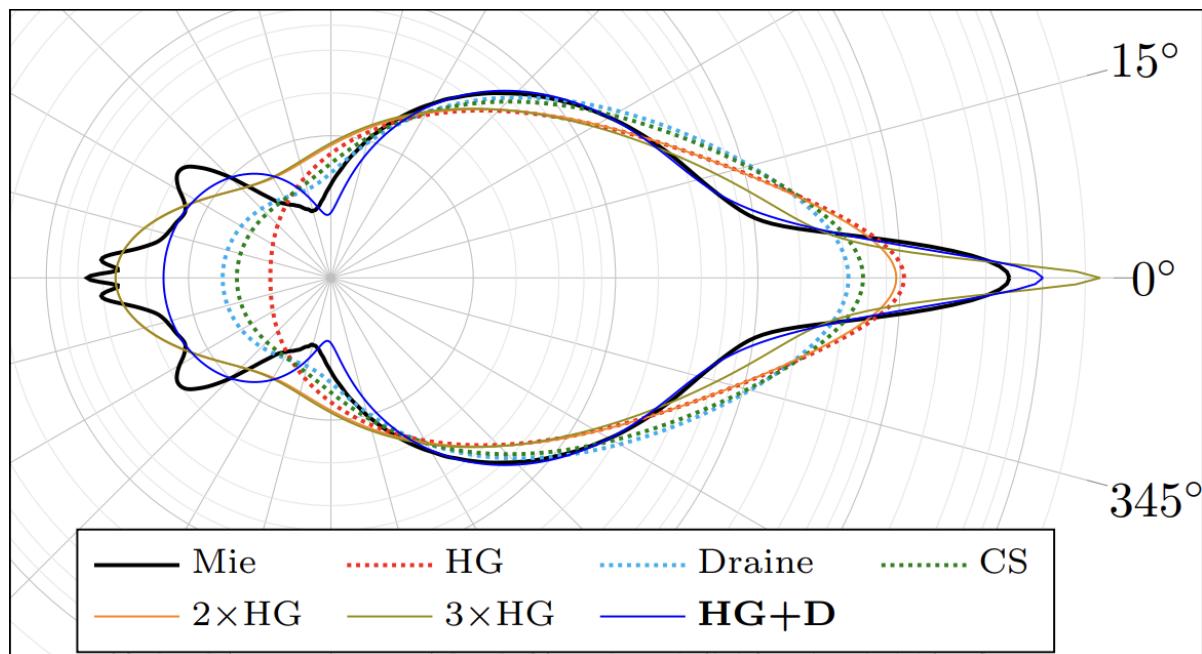

$$P(\phi) = \frac{3}{2} \frac{(1-g^2)}{(2+g^2)} \frac{(1+\cos^2\theta)}{(1+g^2-2g\cos\theta)} + g\cos\theta \quad (12)$$

以下为HG相函数跟CS相函数的效果对比

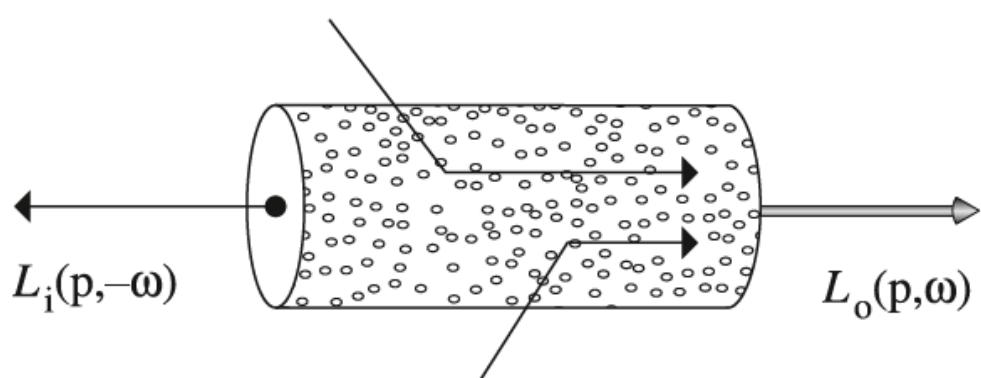

下图为对于米氏散射，各个相位方程的拟合情况

内散射

描述介质中的一个点接收到四面八方来的光线，正好散射到观察方向。

对于出射光，可以由微元的LightSource进行积分得出

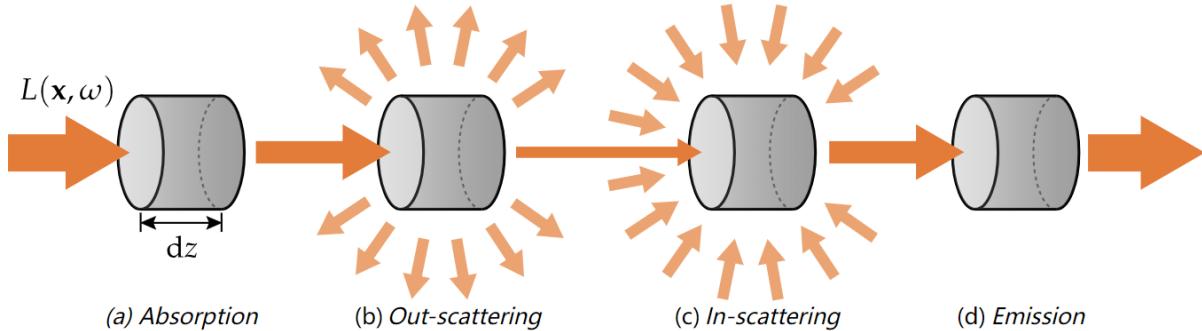

$$dL_o = L_s dt$$

其中, L_s 考虑自发光的情况可以由下式得出

$$L_s = L_e + \sigma_s \int_{S^2} p(\omega_i, \omega_o) L_i d\omega$$

L_e 为自发光, $p(\omega_i, \omega_o)$ 为相函数, 描述由 ω_i 摄入且朝 ω_o 方向散射的概率分布, 然后对整个单位球进行积分。

单次散射

对于体积雾, 多次散射效果很弱, 所以一般只考虑单次散射的情况。下图为从 x_s 着色点的着色结果到观察方向的传输过程, 并且考虑了传输过程中的介质影响, 也就是非真空状态下。

Volumetric rendering: single scattering

$Li(x, \omega_i) = Tr(x, xs) Ls(xs, \omega_o) + \int_0^s Tr(x, xt) \sigma_t(x) Lscat(xt, \omega_i) dt$ $Tr(x, xs) = \exp(- \int_0^s \sigma_t(x) dt)$

$Lscat(xt, \omega_i) = \rho \sum_{l=0}^{lights} f(v, l) Vis(x, l) Li(x, l)$ $Vis(x, l) = shadowMap(x, l) * volumetricShadowMap(x, l)$

SIGGRAPH 2015 – Advances in Real-Time Rendering course

11

$Li(x, \omega_i)$: 观察到的radiance

$Tr(x, xs)$: 为Beer-Lambert定律公式

$Ls(xs, \omega_o)$: 为 x_s 这个着色点的着色结果

$Lscat(xt, \omega_i)$: 为所有影响传输介质中每一个微元的光源且散射向观察方向的radiance

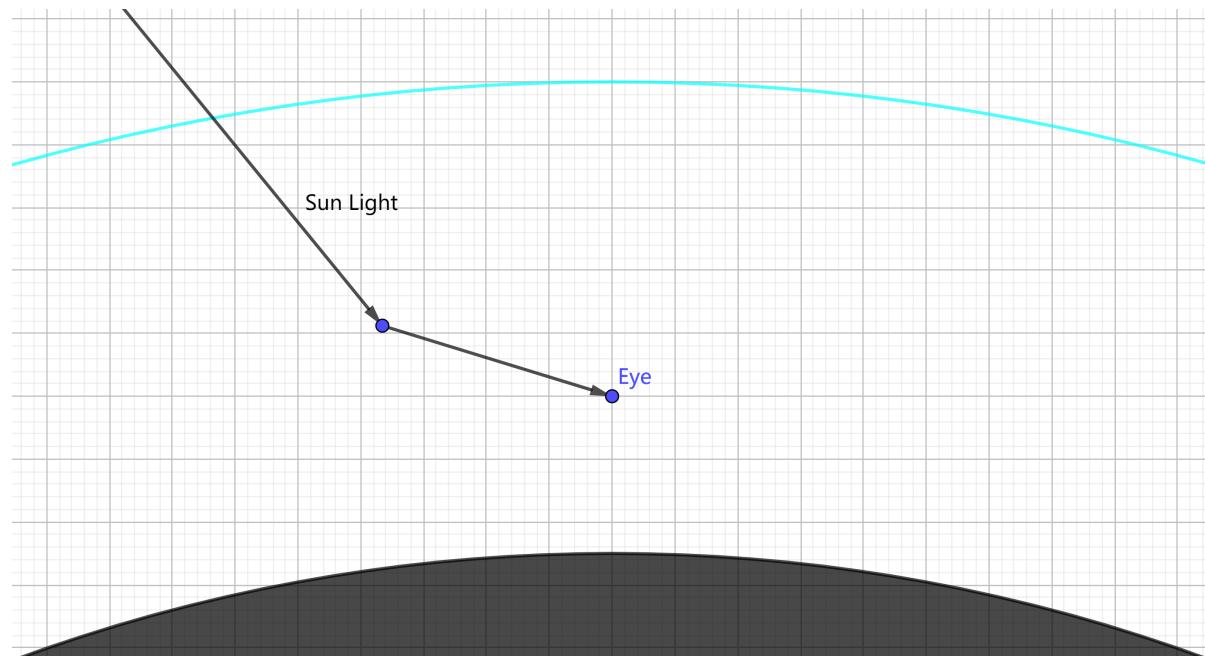

因此, 上图绿色的积分, 可以理解为在介质传输过程中, 对每个微元同一个方向(观察方向) radiance 的累加。

而计算 $Lscat$ 需要对所有影响的光源进行累加, 同时考虑可见度, 即 Vis 项, 因为只考虑观察方向, 因此需要乘相位函数 $f(v, l)$, 类似brdf函数。

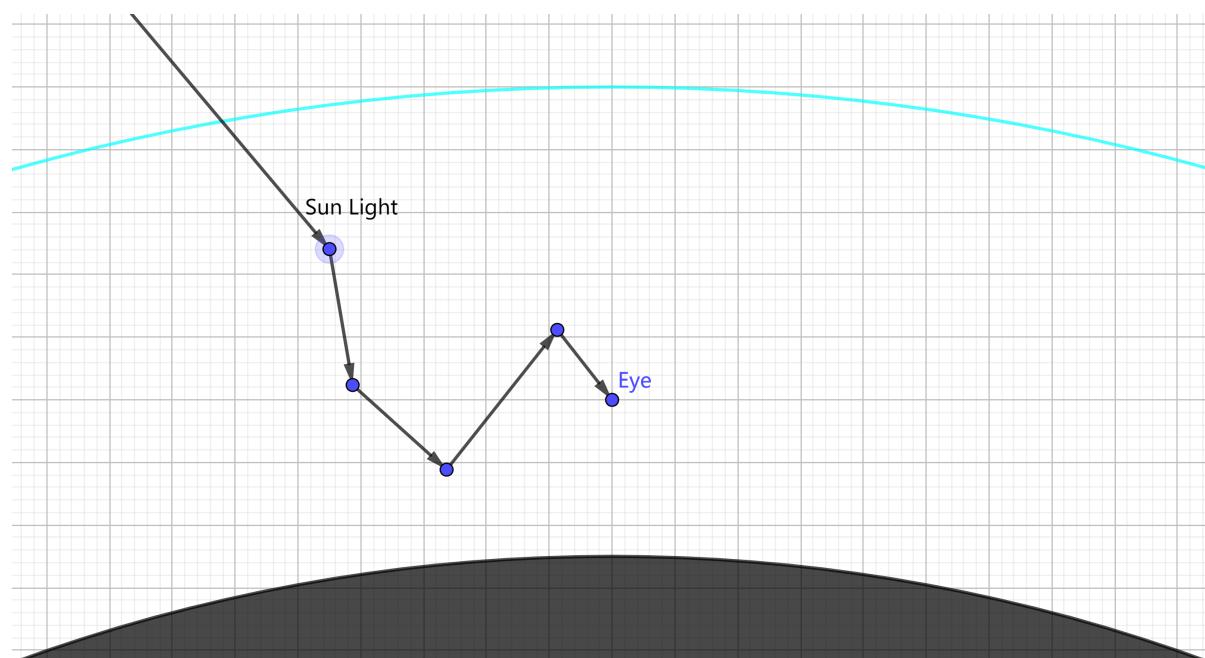

多次散射

对于大气渲染，多次散射跟单次散射的区别如下：

单次散射

多次散射

TODO: URP制作一个Demo场景，展示有无体积雾的效果区别，并打包试跑性能

HDRP中体积雾的实现的基本原理

算法过程

视锥体素化

```
1 struct Ray
2 {
3     float3 originWS;
4     float3 centerDirWS;
5 };
6
7 for(int i = 0; i < bufferWidth; ++i)
8 {
9     for(int j = 0; j < bufferHeight; ++j)
10    {
11         uint2 voxelCoord = uint2(i, j);
12         uint2 voxelCoordCenter = voxelCoord + uint2(0.5, 0.5);
13         // 构造射线
14         Ray ray = Ray(
15             CameraPosition,
16             voxelCoordToRayDir(voxelCoordCenter, near, fov, aspectRatio));
17         // 填充高度雾
18         FillHeightFogBuffer(voxelCoord, ray);
19     }
20 }
```

$$Ray.CurrentPosition = Ray.OriginPosition + t * Ray.Direction$$

高度雾计算

```
1 FillHeightFogBuffer(uint2 voxelCoord2D, Ray ray)
2 {
3     // 获取近平面，也是光线步进的起点t
4     float t0 = ConvertDepthToLinearLengthInLogSpace(0);
5     // 总的深度范围是[0-1]，切了Totalslice片，计算出每一片占据的深度
6     float thicknessPerslice = 1 / Totalslice;
7
8     for (int slice = 0; slice < Totalslice; ++slice)
9     {
10         // 这里算3DTexture的写入坐标
11         uint3 voxelCoord = uint3(voxelCoord2D, slice + thicknessPerslice);
12
13         // 计算当前切片方块的后切片，这里用mad指令，算出来是一个[0-1]的深度值
14         float sliceBackwardPlaneDepth = slice * thicknessPerslice +
thicknessPerslice;
15         // 将深度值转成线性值[near, far]
16         float t1 =
ConvertDepthToLinearLengthInLogSpace(sliceBackwardPlaneDepth);
17
18         float dt = t1 - t0;
19         // 取格子中心点
20         float t = t0 + 0.5 * dt;
21         // 计算出当前格子中心点的世界坐标，用于后面计算高度雾信息
22         float3 voxelCenterWS = ray.originWS + t * ray.centerDirWS;
23         float fragmentHeight = voxelCenterWS.y;
24
25         // 计算高度衰减系数，
26         // _HeightFogBaseHeight, _HeightFogExponents 都是通过艺术家参数传进来的
27         float heightMultiplier =
exp(-max(fragmentHeight - _HeightFogBaseHeight, 0) *
_HeightFogExponents.x);
28
29         _VBufferDensity[voxelCoord] =
30             float4(_HeightFogBaseScattering.xyz * heightMultiplier,
31                   _HeightFogBaseExtinction * heightMultiplier);
32
33         // to the next step
34         t0 = t1;
35
36     }
37 }
38 }
```

The screenshot shows the Unity interface with the HeightFogExponents component selected in the Inspector. The 'Base Height' field is highlighted with a red box. The script editor shows the following code:

```

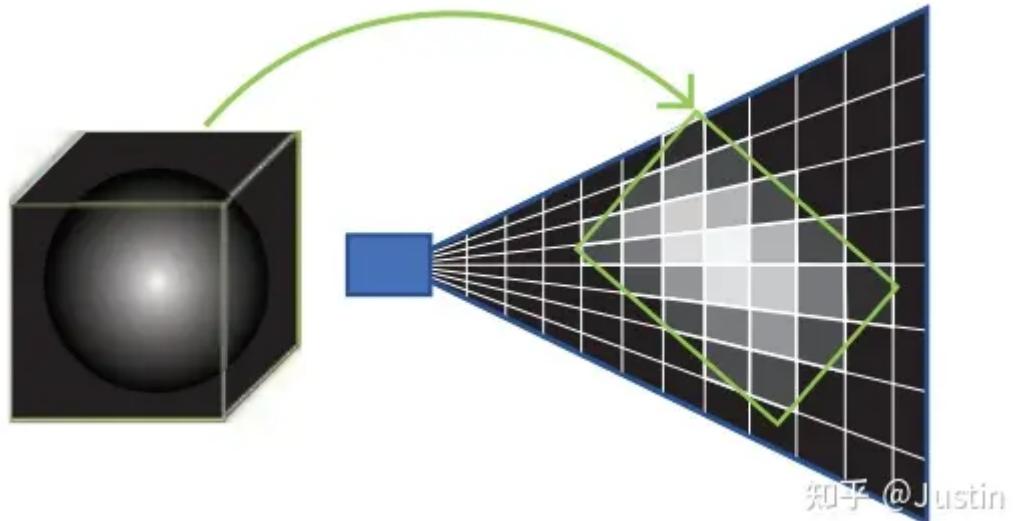

static float ScaleHeightFromLayerDepth(float d)
{
    // Exp(-d / H) = 0.001
    // -d / H = Log[0.001]
    // H = d / -Log[0.001]
    return d * 0.144765f;
}

float layerDepth = Mathf.Max(a: 0.01f, b: maximumHeight.value - baseHeight.value);
float H = ScaleHeightFromLayerDepth(layerDepth);
cb._HeightFogExponents = new Vector2(x: 1.0f / H, y: H);

```

The Inspector also shows the 'Base Height' value is set to 0.

体积雾计算

如图23所示，在场景中放入一个LocalFogVolume组件，需要在体素中去填充VolumeBox包围的体积雾信息。

切片数据准备

这一步需要计算VolumeBox在视锥体体素中的范围（xy范围，和z切片范围），然后为每一个切片生成一个Quad Instance。

```

1 sliceDataPrepare()
2 {
3     foreach(var volume : volumeList)
4     {
5         var tStart, tEnd = GetVolumeRange(volume);
6         var startSlice = DistanceToSlice(tStart);
7         var stopSlice = DistanceToSlice(tEnd);
8         var sliceCount = stopSlice - startSlice;
9
10        var bounds = CalculateViewBounds(volume);
11
12        // fill parameters
13        IndexCountPerQuad = 6;
14        QuadInstanceCount[volumeIndex] = sliceCount;
15        QuadInstanceStartSlice[volumeIndex] = startSlice;
16        QuadInstanceBounds[volumeIndex] = bounds;
17    }
18 }

```

绘制切片

```

1 IndexArray =
2 [
3     0, 1, 2,
4     0, 2, 3
5 ]
6 /*
7     0 ----- 3
8     | . |
9     | . |
10    | . |
11    1 ----- 2
12 */
13 DrawSliceQuad()
14 {
15     for(int instance; instance < QuadInstanceCount; ++instance)
16     {
17         float4 positionCS;
18         // vertexID : [0 - 3]
19         positionCS = VertexIDToVertex(vertexID);
20         // 把坐标映射到Box的范围
21         positionCS = ClampToVolumeBounds(positionCS);
22         positionCS.z = SliceToDepth(QuadStartSliceIndexes[instance]);
23         positionCS.w = 1.0;
24
25         Draw(positionCS);
26     }
27 }

```

填充体积雾数据

```
1 FragForEachSlice() : Target->3DTexture
2 {
3     if (currentPixel out of volumeBox)
4     {
5         discard;
6     }
7
8     albedo = sampler MaskTexture * fogAlbedo.rgb;
9     extinction *= 1 / meanFreePath;
10    pixelColor = float4(saturate(albedo * extinction), extinction);
11 }
```

体积光着色

对于每一条传播路径，对每一次切片计算Radiance结果，并累加（积分）。

对于每一个点（切片单元），需要考虑该处的散射率scattering，和BeerLambert定律。

每一个点的radiance来源有直接光照的入射和环境光，而入射进来的Irradiance，只有一部分会射向观察方向，这部分比例由相位方程来描述。

```
1 Shading()
2 {
3     var totalRadiance = 0;
4
5     for(int slice = 0; slice < TotalSlice; ++slice)
6     {
7         foreach(var light : VisibleLights)
8             { // GIProbeRadiance 已经是考虑了相位方程的结果
```

```

9     totalRadiance += (light.color * light.shadowAtten *
10    light.distanceAtten* CSPhase + GIProbeRadiance) * scattering *
11    BeerLambertFactor;
12
13    out totalRadiance;
14 }

```

抖动

对于每个体素，如果只用一根光线去计算，会导致结果噪点比较多。因此可以通过抖动和结合历史帧数据的方式，实现TAA的效果来进行优化。

对于每一次采样，按照下图所示去选择采样点

参考：https://en.wikipedia.org/wiki/Close-packing_of_equal_spheres

由于该分布具有一定的随机性以及均匀分布性，所以可以实现类似蓝噪声的抖动。

在管线中，通过两个Buffer交替，来实现对于历史帧的融合。

如图26所示，总共由7个采样点，因此需要7帧，每帧选用一个采样点。

```

static uint VolumetricFrameIndex(HDCamera hdCamera)
{
    // Here we do modulo 14 because we need the enable to detect a change every frame, but the accumulation is done on 7 frames (7x2=14)
    return hdCamera.GetCameraFrameCount() % 14;
}

```

之所以选择对14取余数，是因为完整一次叠加需要7帧，两个Buffer交替。

```
// [0 - 13]
int frameIndex = (int)VolumetricFrameIndex(hdCamera);
var currIdx:int = (frameIndex + 0) & 1;
var prevIdx:int = (frameIndex + 1) & 1;
```

偶数帧:

current: 0

preview: 1

奇数帧:

current: 1

preview: 0

FrameIndex	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14
Current	0	1	0	1	0	1	0	1	0	1	0	1	0	1	0
History	1	0	1	0	1	0	1	0	1	0	1	0	1	0	1

重投影

在拿历史帧数据的时候，需要用当前Voxel的世界坐标，通过上一帧VP矩阵以及上一帧相机的世界坐标重新还原uvw，然后去采样HistroyBuffer。

这里考虑Volume是静态的，因此Voxel的世界坐标不会改变，因此可以算出上一帧的深度，推算出Slice。

最后将历史帧与当前帧结果进行融合。

$$\text{CurrentFrame} = \text{Lerp}(\text{CurrentFrame}, \text{HistroyFrame}, 6/7)$$

高斯滤波

对于2D的Texture，进行3X3高斯滤波就是对九宫格进行加权（高斯函数计算权重）平均。

```
1 GaussianFiltering()
2 {
3     const int radius = 1;
4     // 对每个切片做3x3高斯模糊
```

```

5   for (int idx = -radius; idx <= radius; ++idx)
6   {
7       for (int idx2 = -radius; idx2 <= radius; ++idx2)
8       {
9           float4 currentValue = GetSample(voxelCoord.xy + int2(idx,
10          idx2));
11
12           // Compute the weight for this tap
13           float weight = Gaussian(length(int2(idx, idx2)),
14           GAUSSIAN_SIGMA);
15
16           // Accumulate the value and weight
17           value += currentValue * weight;
18           sumW += weight;
19       }
20
21   output value / sumW
22
23 }

```

管线

基于RenderGraph管线，RenderGraph是一种基于新一代的图形API去设计的管线架构，每一帧渲染的Pass都可以根据资源的依赖关系抽象出一个有向无环图。RenderGraph可以通过依赖关系以及生命周期，通过资源别名系统实现资源的复用，以及自动算好AsyncCompute的同步点。

RenderGraph主要分为三个阶段：Setup，Compile，Execute。Setup阶段可以比较乐观的去添加各种Pass，并且标记好资源的读写，Compile阶段会根据资源的依赖关系，剔除不必要的Pass和资源。Execute会最终去执行各个Pass。

在HDRP中，体积雾是通过LocalVolumetricFog组件来添加的，在管线的RecordRenderGraph方法中

```

1 // 添加第一个Pass，并且返回3DTexture的handle
2 var volumetricDensityBuffer = ClearAndHeightFogVoxelizationPass(m_RenderGraph,
hdCamera);

```

```

1 // 添加第二个Pass，将第一个Pass计算出来高度雾3DTexture作为输入，同时也作为输出
2 volumetricDensityBuffer = FogVolumeVoxelizationPass(m_RenderGraph, hdCamera,
3 volumetricDensityBuffer, m_VisibleVolumeBoundsBuffer);
4
5 // 添加着色Pass
6 var volumetricLighting = VolumetricLightingPass(m_RenderGraph, hdCamera,
7     preprocessOutput.depthPyramidTexture, volumetricDensityBuffer,
8     maxZMask, gpuLightListOutput.bigTileLightList, shadowResult);

```

总共有三个Pass，第一个Pass负责体素化并填充高度衰减散射率和总衰减系数，第二个Pass负责计算体积雾的密度数据，第三个Pass根据密度Buffer进行体积光着色。

Pass

Clear and Height Fog Voxelization

以下是在ComputeShader中要写的buffer

```

1 RW_TEXTURE3D(float4, _vBufferDensity); // RGB = sqrt(scattering), A =
    sqrt(extinction)

```

以下代码是3DTexture的声明

```

1 // 在第一个Pass添加时创建3DTexture并标记为write
2 passData.densityBuffer = builder.WriteTexture(renderGraph.CreateTexture(
3     new TextureDesc(s_CurrentVolumetricBufferSize.x,
4         s_CurrentVolumetricBufferSize.y, false, false)
5     { slices = s_CurrentVolumetricBufferSize.z,
6         colorFormat = GraphicsFormat.R16G16B16A16_SFloat,
7         dimension = TextureDimension.Tex3D, enableRandomWrite = true, name =
8         "vBufferDensity" }));

```

以下代码计算3DTexture的尺寸，通过配置的屏幕划分比例和深度占比来计算

```

1 // Update size used to create volumetric buffers.
2 // 3DTexture的尺寸根据屏幕分块数和深度分块数来确定
3 s_CurrentVolumetricBufferSize = new
4     Vector3Int(Math.Max(s_CurrentVolumetricBufferSize.x,
5         currentParams.viewportSize.x),
6         Math.Max(s_CurrentVolumetricBufferSize.y, currentParams.viewportSize.y),
7         Math.Max(s_CurrentVolumetricBufferSize.z, currentParams.viewportSize.z));

```

以下代码是VBuffer在shader中计算需要用到的相关参数

```

1 struct vBufferParameters
2 {
3     public Vector3Int viewportSize;
4     public float voxelSize;
5     public Vector4 depthEncodingParams;
6     public Vector4 depthDecodingParams;
7 }

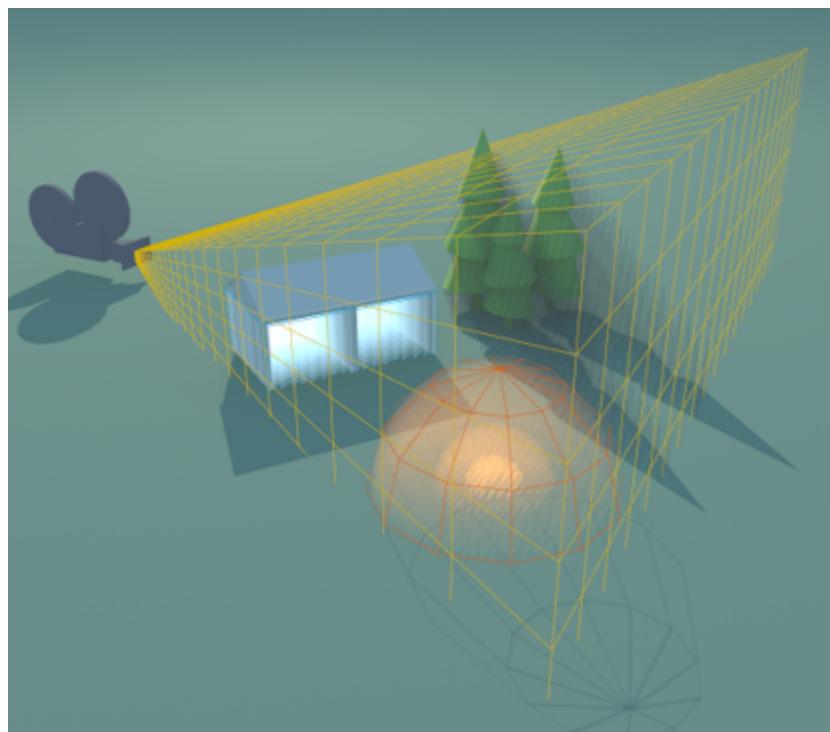

```

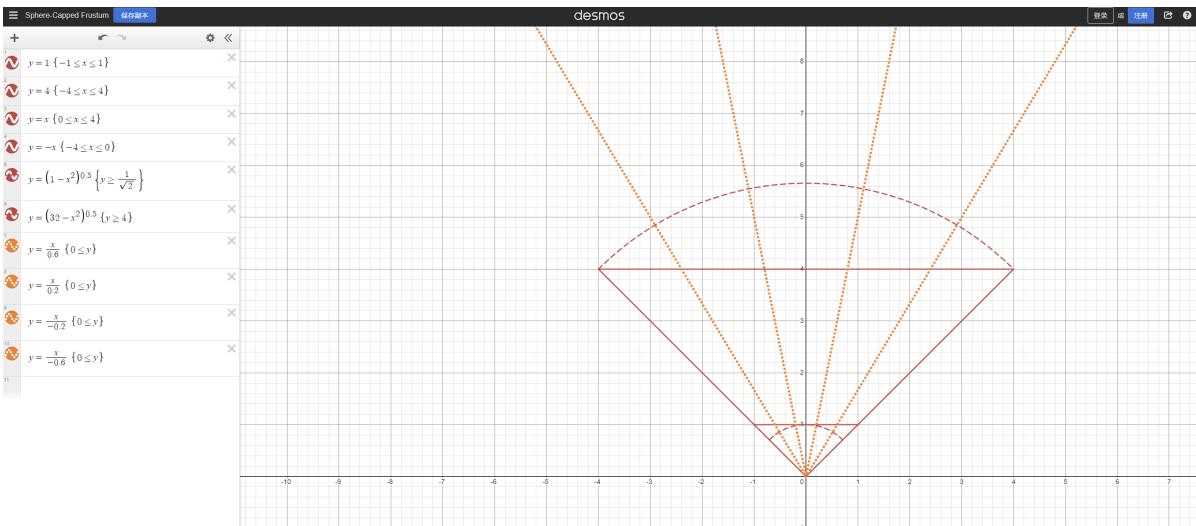

```

1 public void BufferParameters(Vector3Int viewportSize, float depthExtent, float
2 camNear, float camFar, float camVFOV,
3                                     float sliceDistributionUniformity, float voxelSize)
4 {
5     this.viewportSize = viewportSize;
6     this.voxelSize = voxelSize;
7
8     // The V-Buffer is sphere-capped, while the camera frustum is not.
9     // we always start from the near plane of the camera.
10
11    float aspectRatio = viewportSize.x / (float)viewportSize.y;
12    float farPlaneHeight = 2.0f * Mathf.Tan(0.5f * camVFOV) * camFar;
13    float farPlaneWidth = farPlaneHeight * aspectRatio;
14    float farPlaneMaxDim = Mathf.Max(farPlaneWidth, farPlaneHeight);
15    // 求出最远的距离，也就是斜边的长度，根据勾股定理
16    float farPlaneDist = Mathf.Sqrt(camFar * camFar + 0.25f * farPlaneMaxDim
17 * farPlaneMaxDim);
18    // 求出最近的距离，也就是垂直的camNear
19    float nearDist = camNear;
20    // 通过配置的depthExtent求出深度范围
21    float farDist = Math.Min(nearDist + depthExtent, farPlaneDist);
22    // 将分布参数重映射
23    float c = 2 - 2 * sliceDistributionUniformity; // remap [0, 1] -> [2, 0]
24    c = Mathf.Max(c, 0.001f); // Avoid NaNs
25
26    depthEncodingParams = ComputeLogarithmicDepthEncodingParams(nearDist,
farDist, c);
27    depthDecodingParams = ComputeLogarithmicDepthDecodingParams(nearDist,
farDist, c);
28 }

```

下面的代码是用于计算变换矩阵（是第一个Pass最关键的部分，用于视锥体体素化）

screenSize为RT的size, x: width, y: height, z: 1/width, w: 1/height

```
1 aspectRatio = aspectRatio < 0 ? screenSize.x * screenSize.w : aspectRatio;
2 float tanHalfVertFov = Mathf.Tan(0.5f * verticalFoV);
3
4 // Compose the matrix.
5
6 float m00 = -2.0f * screenSize.z * tanHalfVertFov * aspectRatio;
7 float m11 = -2.0f * screenSize.w * tanHalfVertFov;
8
9 // 镜头平移，一般用于建筑摄影
10 float m21 = (1.0f - 2.0f * lensShift.y) * tanHalfVertFov;
11 float m20 = (1.0f - 2.0f * lensShift.x) * tanHalfVertFov * aspectRatio;
12
```

```
1 viewSpaceRasterTransform = new Matrix4x4(0
2     new Vector4(m00, 0.0f, 0.0f, 0.0f),
3     new Vector4(0.0f, m11, 0.0f, 0.0f),
4     new Vector4(m20, m21, -1.0f, 0.0f),
5     new Vector4(0.0f, 0.0f, 0.0f, 1.0f));
```

```
1 // Remove the translation component.  
2 var homogeneousZero = new Vector4(0, 0, 0, 1);  
3 worldToViewMatrix.SetColumn(3, homogeneousZero);  
4  
5 // Flip the z to make the coordinate system left-handed.  
6 worldToViewMatrix.SetRow(2, -worldToViewMatrix.GetRow(2));  
7  
8 // Transpose for HLSL.  
9 return Matrix4x4.Transpose(worldToViewMatrix.transpose *  
viewSpaceRasterTransform);
```

以下是ComputeShader中的代码

```
1 // 相机的 -z  
2 float3 F = GetViewForwardDir();  
3 // 相机的 y  
4 float3 U = GetViewUpDir();  
5 // 假设线程数为512x512 则 dispatchThreadId.xy 范围[0-511]
```

```

6  uint2 voxelCoord = dispatchThreadId.xy;
7  float2 centerCoord = voxelCoord + float2(0.5, 0.5);
8
9  // Compute a ray direction s.t. viewSpace(rayDirWS).z = 1.
10 /**
11  *          [ m00, m01, m02, m03 ]
12  *          [ m10, m11, m12, m13 ]
13  *  [x,y,z,w] * [ m20, m21, m22, m23 ]
14  *          [ m30, m31, m32, m33 ]
15  *
16  */
17 /**
18 float3 rayDirWS      = mul(-float4(centerCoord, 1, 1),
19 _VBufferCoordToViewDirWS[unity_StereoEyeIndex]).xyz;
20 float3 rightDirWS   = cross(rayDirWS, U);
21 float rcpLenRayDir  = rsqrt(dot(rayDirWS, rayDirWS));
22 float rcpLenRightDir = rsqrt(dot(rightDirWS, rightDirWS));
23
24 JitteredRay ray;
25 ray.originWS     = GetCurrentViewPosition();
26 ray.centerDirWS = rayDirWS * rcpLenRayDir; // Normalize
27
28 // 计算出 forward 跟 rayDir 的 cos 值
29 float FdotD = dot(F, ray.centerDirWS);
30 /**
31 * _VBufferUnitDepthTexelSpacing : 远平面每个纹素占据多大单位
32 * FdotD * rcpLenRayDir :
33 * 因为单位格子下，越靠近屏幕中心，格子对应的立体角越大。
34 */
35 float unitDistFaceSize = _VBufferUnitDepthTexelSpacing * FdotD *
36 rcpLenRayDir;
37 // 越靠近视野中心，导数越大
38 ray.xDirDerivWS = rightDirWS * (rcpLenRightDir * unitDistFaceSize); // Normalize & rescale
39 ray.yDirDerivWS = cross(ray.xDirDerivWS, ray.centerDirWS); // will have the
40 // length of 'unitDistFaceSize' by construction
41 ray.jitterDirWS = ray.centerDirWS; // TODO ???
42
43 FillVolumetricDensityBuffer(voxelCoord, ray);

```

以下是填充高度雾的 shader 代码

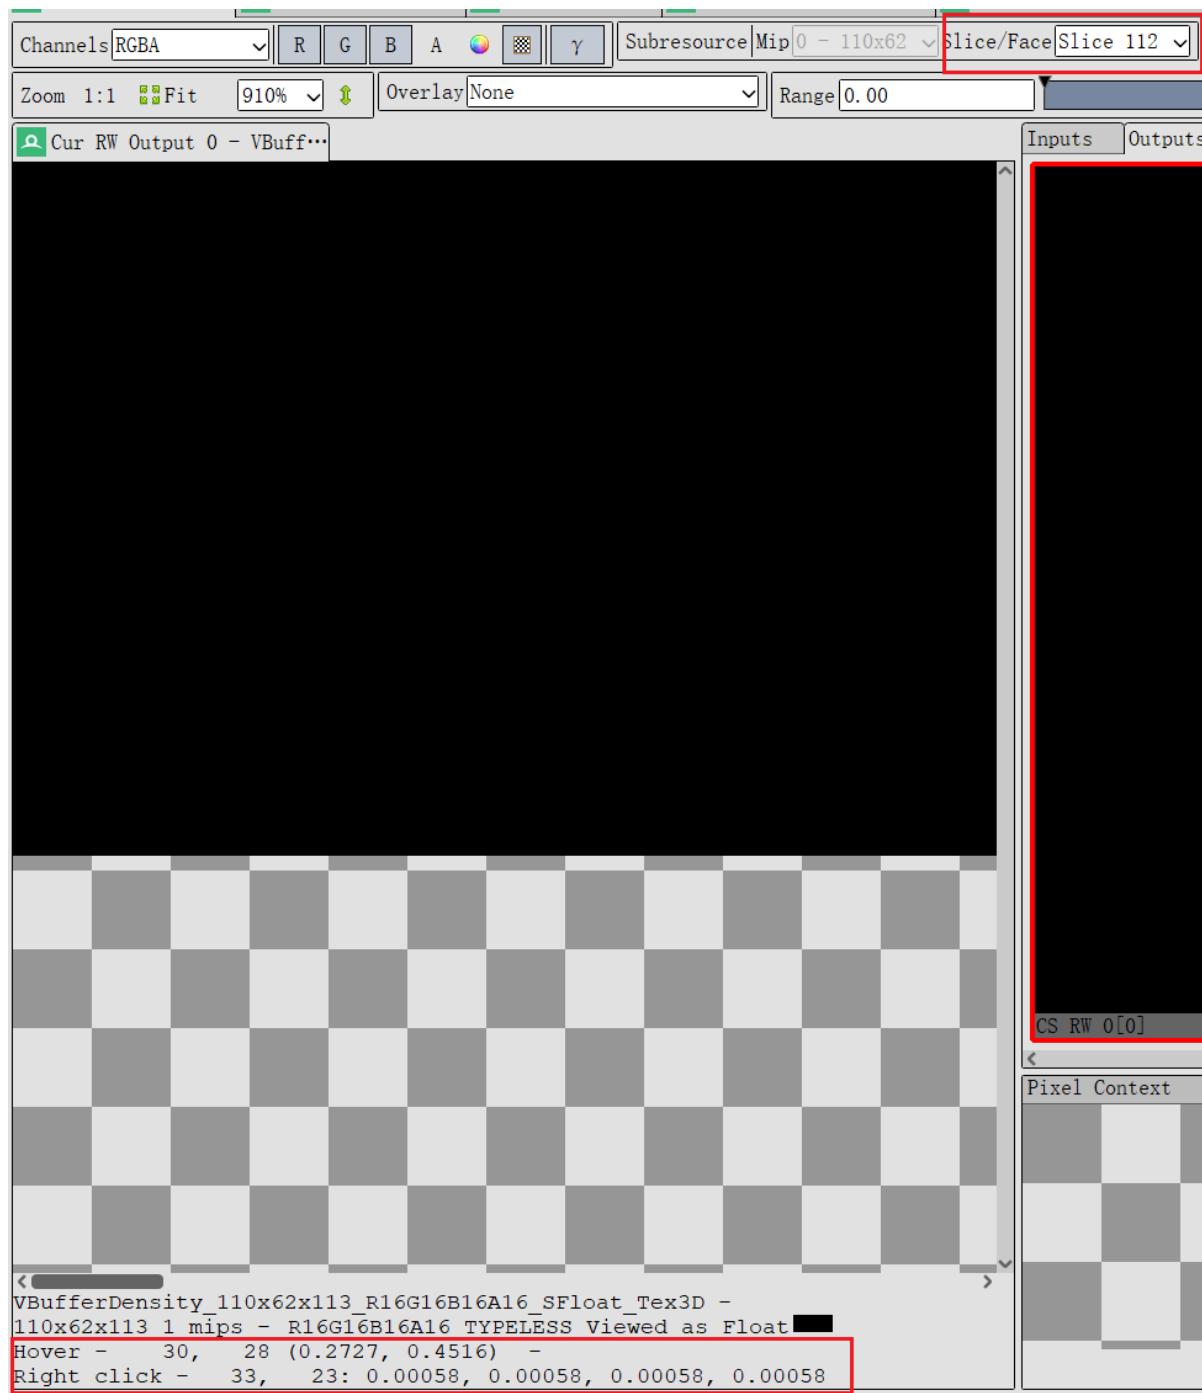

```

1 // 将深度0映射到近平面
2 float t0 = DecodeLogarithmicDepthGeneralized(0,
3 _VBufferDistanceDecodingParams);
4 // ????? 这里貌似没有进行 Log-encoded 啊 ??????
5 float de = _VBufferRcpSliceCount; // Log-encoded distance between slices
6
7 // _VBuffersSliceCount 在 RecordAndExecute 之前，已经通过 UpdateGlobalConstant 传递来了
8 for (uint slice = 0; slice < _VBuffersSliceCount; slice++)
{

```

```
9     uint3 voxelCoord = uint3(voxelCoord2D, slice + _vBuffersSliceCount *  
10    unity_StereoEyeIndex);  
11  
12     float e1 = slice * de + de; // (slice + 1) / sliceCount  
13     float t1 = DecodeLogarithmicDepthGeneralized(e1,  
14         _VBufferDistanceDecodingParams);  
15     float dt = t1 - t0;  
16     float t = t0 + 0.5 * dt;  
17  
18     float3 voxelCenterWS = ray.originWS + t * ray.centerDirWS;  
19  
20     // TODO: the fog value at the center is likely different from the  
21     // average value across the voxel.  
22     // Compute the average value.  
23     float fragmentHeight = voxelCenterWS.y;  
24     float heightMultiplier = ComputeHeightFogMultiplier(fragmentHeight,  
25         _HeightFogBaseHeight, _HeightFogExponents);  
26  
27     // Start by sampling the height fog.  
28     float3 voxelScattering = _HeightFogBaseScattering.xyz *  
29         heightMultiplier;  
30     float voxelExtinction = _HeightFogBaseExtinction * heightMultiplier;  
31  
32     _vBufferDensity[voxelCoord] = float4(voxelScattering, voxelExtinction);  
33  
34     t0 = t1;  
35 }
```

计算结果如下

以下是深度切片分布系数

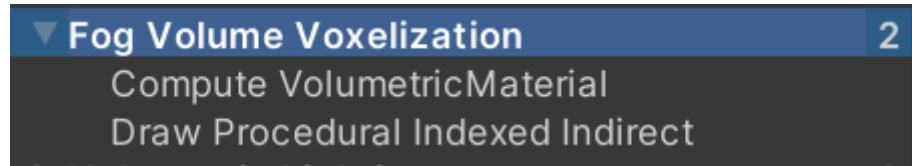

```
// 将分布参数重映射
float c = 2 - 2 * sliceDistributionUniformity; // remap [0, 1] -> [2, 0] c: 0.5 ~ sliceDistributionUniformity
c = Mathf.Max(a:c, b:0.001f); // Avoid NaNs c: 0.5

→ depthEncodingParams = ComputeLogarithmicDepthEncodingParams(nearDist, farDist, c); c: 0.5 farDist: 64.30000
depthDecodingParams = ComputeLogarithmicDepthDecodingParams(nearDist, farDist, c) {float} 64.3000031 ⓘ
```

深度按Log分布比例是0.5, 图像如下

Fog Volume Voxelization

Compute VolumetricMaterial

1 | Runtime/Material/volumetricMaterial/volumetricMaterial.compute

以下是ComputeShader中的代码

```
1 // Generate the compute buffer to dispatch the indirect draw
2 // 每个线程组分配32个线程，线程组数量为32个volume共用一个线程组，相当于一个线程对应一个
3 // volume
4 [numthreads(32, 1, 1)]

87     _IndirectBufferArguments[volumewriteIndex * 5 + 3] = 0; // BaseVertexLocation
88     _IndirectBufferArguments[volumewriteIndex * 5 + 4] = 0; // StartInstanceLocation
89
90     _volumetricMaterialData[volumewriteIndex].sliceCount = sliceCount;
91     _volumetricMaterialData[volumewriteIndex].startSliceIndex =
92         startSliceIndex;
93     _volumetricMaterialData[volumewriteIndex].viewSpaceBounds =
94         float4(minPositionVS, maxPositionVS - minPositionVS);
95 }
```

以下代码是DistanceDistanceToOBB的计算过程

```

1 float DistanceDistanceToOBB(float3 p, OrientedBBox obb)
2 { // offset为由volume中心指向相机原点的向量, p为相机的世界坐标
3     float3 offset = p - obb.center;
4     // volume的forward向量
5     float3 boxForward = normalize(cross(obb.right, obb.up));
6     // 把offset投影到volume的正交基, 相当于转到了volumeOBB的空间坐标系, extent则变成了volume空间下的坐标
7     // 因此得到的axisAlignedPoint相当于相机在volumeOBB坐标系下的位置
8     float3 axisAlignedPoint = float3(dot(offset, normalize(obb.right)),
9         dot(offset, normalize(obb.up)), dot(offset, boxForward));
10    // 最后计算点到AABB的距离, 就可以得出相机跟volume的距离了
11    return DistanceToAABB(axisAlignedPoint, float3(obb.extentX, obb.extentY,
12        obb.extentZ));
13
14 // 这里其实算的是有向距离, 也就是在box内是负的
15 float DistanceToAABB(float3 p, float3 b)
16 { // 对于b, 描述的是box的size, 而p可能位于8个象限的任意一个, 而这里算距离, 只需要考虑第一象限, 因此取绝对值
17     // 减去b, 可以得出q的分量存的是各个轴上的距离
18     float3 q = abs(p) - b;
19     // 这一步的计算原理见下图,
20     // 当p在box外, 则结果为length(max(q, 0.0))
21     // 当p在box内, 则length(max(q, 0.0)) = 0, 结果是min(max(q.x, max(q.y,
22         q.z)), 0.0)
23     return length(max(q, 0.0)) + min(max(q.x, max(q.y, q.z)), 0.0);
24 }
```

以下代码是ComputeCubeVertexPositionRWS的计算过程

```
1 float3 ComputeCubeVertexPositionRWS(OrientedBoundingBox obb, float3 minPositionRWS,
2 float3 vertexMask)
3 { // 构造正交基
4     float3x3 obbFrame = float3x3(obb.right, obb.up, cross(obb.right,
5         obb.up));
6     float3 obbExtents = float3(obb.extentX, obb.extentY, obb.extentZ);
7     //// (vertexMask * 2 - 1) * obbExtents 为volume空间下, 各个顶点的向量
8     //// mul((vertexMask * 2 - 1) * obbExtents, (obbFrame)) 把向量转换到世界空
9     // 间, 类似TBN
10    //// 得出由世界原点指向volume各个顶点的向量 (世界空间下)
11    return mul((vertexMask * 2 - 1) * obbExtents, (obbFrame)) + obb.center;
12 }
```

最终这个Pass的输出是

```
1 _IndirectBufferArguments[volumeWriteIndex * 5 + 0] = 6; // 
2 IndexCountPerInstance
3 _IndirectBufferArguments[volumeWriteIndex * 5 + 1] = sliceCount; // 
4 InstanceCount
5 _IndirectBufferArguments[volumeWriteIndex * 5 + 2] = 0; // StartIndexLocation
6 _IndirectBufferArguments[volumeWriteIndex * 5 + 3] = 0; // BaseVertexLocation
7 _IndirectBufferArguments[volumeWriteIndex * 5 + 4] = 0; // 
8 StartInstanceLocation
9 // 当前volume在视锥体体素中占据的切片数
10 _volumetricMaterialData[volumeWriteIndex].sliceCount = sliceCount;
11 _VolumetricMaterialData[volumeWriteIndex].startSliceIndex = startSliceIndex;
12 _VolumetricMaterialData[volumeWriteIndex].viewSpaceBounds =
13 float4(minPositionVS, maxPositionVS - minPositionVS);
```

下图是DX关于IndirectBufferArgs的内存布局规定

Bytes	Description
0:3	IndexCountPerInstance
4:7	InstanceCount
8:11	StartIndexLocation
12:15	BaseVertexLocation
16:19	StartInstanceLocation
20:35	Padding

DrawProcedural Indexed Indirect

通过DrawProceduralIndirect绘制，有2种着色模式，以及5种Blend模式，不同的Blend模式选择不同的PassIndex

Blend

Overwrite

Blend One Zero, One Zero

BlendOp Add, Add

Additive

Blend One One, One One

BlendOp Add, Add

Multiply

Blend DstColor Zero, DstAlpha Zero

BlendOp Add, Add

(该模式下shader会做特殊处理)

```
1 | outColor = max(0, lerp(float4(1.0, 1.0, 1.0, 1.0), float4(saturate(albedo * extinction), extinction), fade.xxxx));
```

Min

Blend One One, One One

BlendOp Min, Min

Max

Blend One One, One One

BlendOp Max, Max

以下代码是DrawProceduralIndirect的顶点索引定义

```
m_VolumetricMaterialIndexBuffer = new GraphicsBuffer(GraphicsBufferUsageType.IndexBuffer);
m_VolumetricFogSortKeys = new NativeArray<uint>(asset.currentPlatform);
m_VolumetricFogSortKeysTemp = new NativeArray<uint>(asset.currentPlatform);
// Index buffer for triangle fan with max 6 vertices
m_VolumetricMaterialIndexBuffer.SetData(new List<uint>{
    0, 1, 2,
    0, 2, 3,
    0, 3, 4,
    0, 4, 5
});
```

以下是绘制的代码

```
1 | /// triangleFanIndexBuffer
```

```

2  //// 0, 1, 2,
3  //// 0, 2, 3,
4  //// 0, 3, 4,
5  //// 0, 4, 5
6  /*
7   0 ----- 3
8   | . |
9   | . |
10  | . |
11  1 ----- 2
12 */
13
14 ctx.cmd.DrawProceduralIndirect(
15     // 绘制的顶点Index
16     data.triangleFanIndexBuffer,

以下代码是通过vertexId构造顶点

```
1 // 0 - 0,1
2 // 1 - 0,0
3 // 2 - 1,0
4 // 3 - 1,1
5 // index 是
6 /// 0, 1, 2,
7 /// 0, 2, 3,
8 // 因此vertexID的范围是 0 ~ 3
9 float4 GetQuadVertexPosition(uint vertexID, float z = UNITY_NEAR_CLIP_VALUE)
10 { // 0 - 0
11     // 1 - 0
12     // 2 - 1
13     // 3 - 1
14     uint topBit = vertexID >> 1;
15     // 0 - 0,
16     // 1 - 1,
17     // 2 - 0,
18     // 3 - 1
19     uint botBit = (vertexID & 1);
20     float x = topBit;
21     float y = 1 - (topBit + botBit) & 1; // produces 1 for indices 0,3 and 0
22     for 1,2
23         float4 pos = float4(x, y, z, 1.0);
24 #ifdef UNITY_PRETRANSFORM_TO_DISPLAY_ORIENTATION
25     pos = ApplyPretransformRotation(pos);
26 #endif
27     return pos;
28 }
```

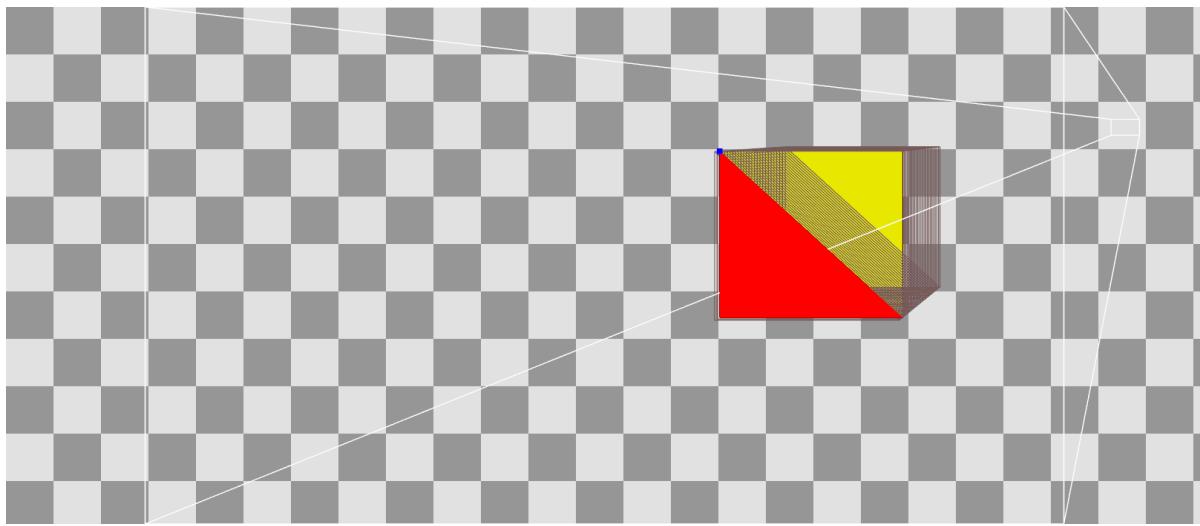

下图是GetQuadVertexPosition得出来的结果展示

经过Clamp，Vert着色器最终输出的CS坐标正好为Volume在屏幕的Box范围，且每一个切片一个 Quad Instance 如下图

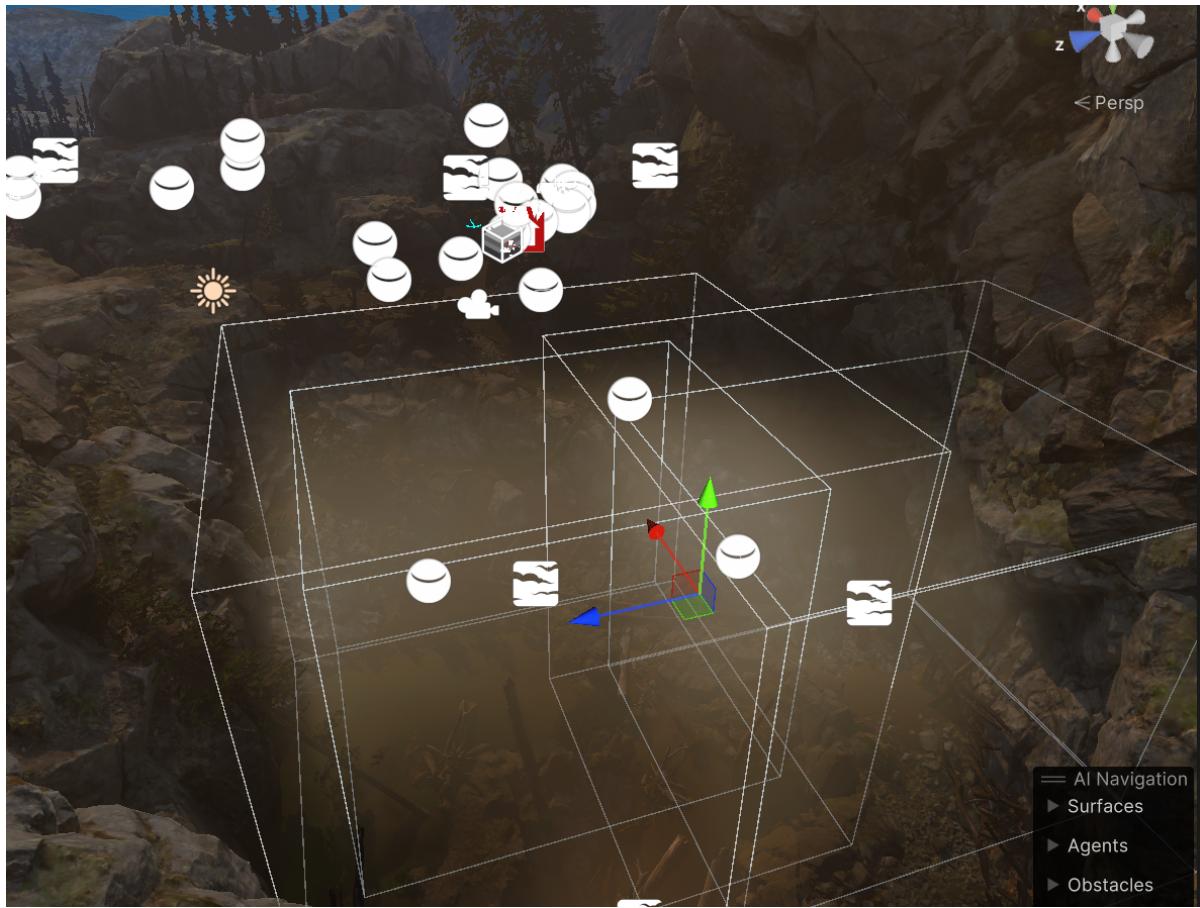

下图展示实际绘制的切片（相机拉远时）

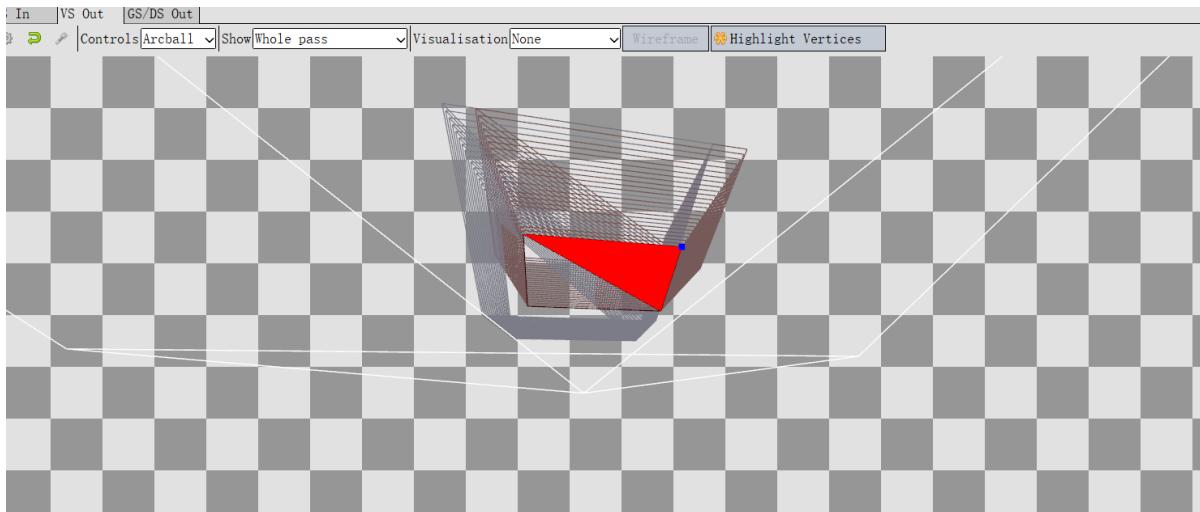

相机拉近时

如果屏幕中可见的Volume有两个，如下图

则需要调用两次cmd.DrawProceduralIndirect

下一步开始进行着色

TextureMask

Runtime/RenderPipelineResources/ShaderGraph/DefaultFogVolume.shadergraph

```

1 void Frag(VertexToFragment v2f, out float4 outColor : SV_Target0)
2 {
3 }
```

```

4     // Setup VR stereo eye index manually because we use the
5     // SV_RenderTargetArrayIndex semantic which conflicts with XR macros
6     #if defined(UNITY_SINGLE_PASS_STEREO)
7         unity_StereoEyeIndex = _ViewIndex;
8     #endif
9
10    float3 albedo;
11    float extinction;
12    // 把3DTexture的z坐标转成切片深度值
13    float sliceDepth = vBufferDistanceToSliceIndex(v2f.depthSlice %
14        _VBuffersSliceCount);
15    float3 cameraForward = -UNITY_MATRIX_V[2].xyz;
16    float sliceDistance = sliceDepth; // dot(-v2f.viewDirectionWS,
17                                    cameraForward);
18
19    // Compute voxel center position and test against volume OBB
20    float3 raycenterDirWS = normalize(-v2f.viewDirectionWS); // Normalize
21    float3 rayoriginWS = GetCurrentViewPosition();
22    // 计算出当前切片的体素中心点世界坐标
23    float3 voxelCenterWS = rayoriginWS + sliceDistance * raycenterDirWS;
24    // 构造正交基
25    float3x3 obbFrame = float3x3(_volumetricMaterialOBBRight.xyz,
26        _volumetricMaterialOBBUp.xyz, cross(_volumetricMaterialOBBRight.xyz,
27        _volumetricMaterialOBBUp.xyz));
28    // voxelCenterWS - _volumetricMaterialOBBCenter.xyz 相当于由box中心指向顶点
29    // 的世界向量
30    // 下一步运算要把世界向量转成Box空间下的向量，由于obbFrame是世界空间下的正交基，因此
31    // 需要求逆矩阵
32    // 又因为obbFrame是正交矩阵，逆等于它的转置
33    float3 voxelCenterBS = mul(voxelCenterWS -
34        _volumetricMaterialOBBCenter.xyz, transpose(obbFrame));
35    // 进行归一化
36    float3 voxelCenterCS = (voxelCenterBS *
37        rcp(_volumetricMaterialOBBExtents.xyz));
38
39    // Still need to clip pixels outside of the box because of the froxel
40    // buffer shape
41    // 如果不进行剔除，则渲染出来的Quad会超出volumeBox的范围
42    bool overlap = Max3(abs(voxelCenterCS.x), abs(voxelCenterCS.y),
43        abs(voxelCenterCS.z)) <= 1;
44    if (!overlap)
45        clip(-1);
46
47    FragInputs fragInputs = BuildFragInputs(v2f, voxelCenterBS,
48        voxelCenterCS);
49    // 采样Mask贴图
50    GetVolumeData(fragInputs, v2f.viewDirectionWS, albedo, extinction);
51
52    // Accumulate volume parameters
53    // 根据LocalVolumeFog的衰减距离累积衰减值
54    extinction *= _volumetricMaterialExtinction;
55    // LocalVolumeFog的反照率
56    albedo *= _volumetricMaterialAlbedo.rgb;
57
58    float3 voxelCenterNDC = saturate(voxelCenterCS * 0.5 + 0.5);
59    // 计算衰减

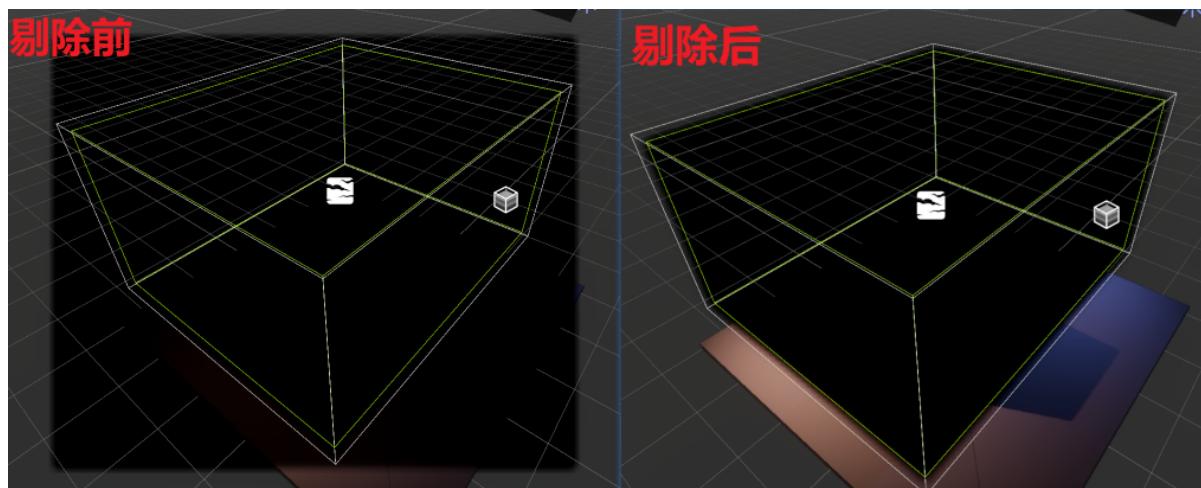

```

```

48     float fade = ComputeFadeFactor(voxelCenterNDC, sliceDistance);
49
50     // When multiplying fog, we need to handle specifically the blend area
51     // to avoid creating gaps in the fog
52 #if defined FOG_VOLUME_BLENDING_MULTIPLY
53     outColor = max(0, lerp(float4(1.0, 1.0, 1.0, 1.0),
54     float4(saturate(albedo * extinction), extinction), fade.xxxx));
55 #else
56     extinction *= fade;
57     outColor = max(0, float4(saturate(albedo * extinction), extinction));
58 #endif
59 }

```

下图展示做Box剔除前后的区别，剔除后可以减少一些不必要的片元的计算

```

1 void GetVolumeData(FragInputs fragInputs, float3 v, out float3
scatteringColor, out float density)
2 {
3     SurfaceDescriptionInputs surfaceDescriptionInputs =
FragInputsToSurfaceDescriptionInputs(fragInputs, v);
4     SurfaceDescription surfaceDescription =
SurfaceDescriptionFunction(surfaceDescriptionInputs);
5
6     scatteringColor = surfaceDescription.BaseColor;
7     density = surfaceDescription.Alpha;
8 }

```

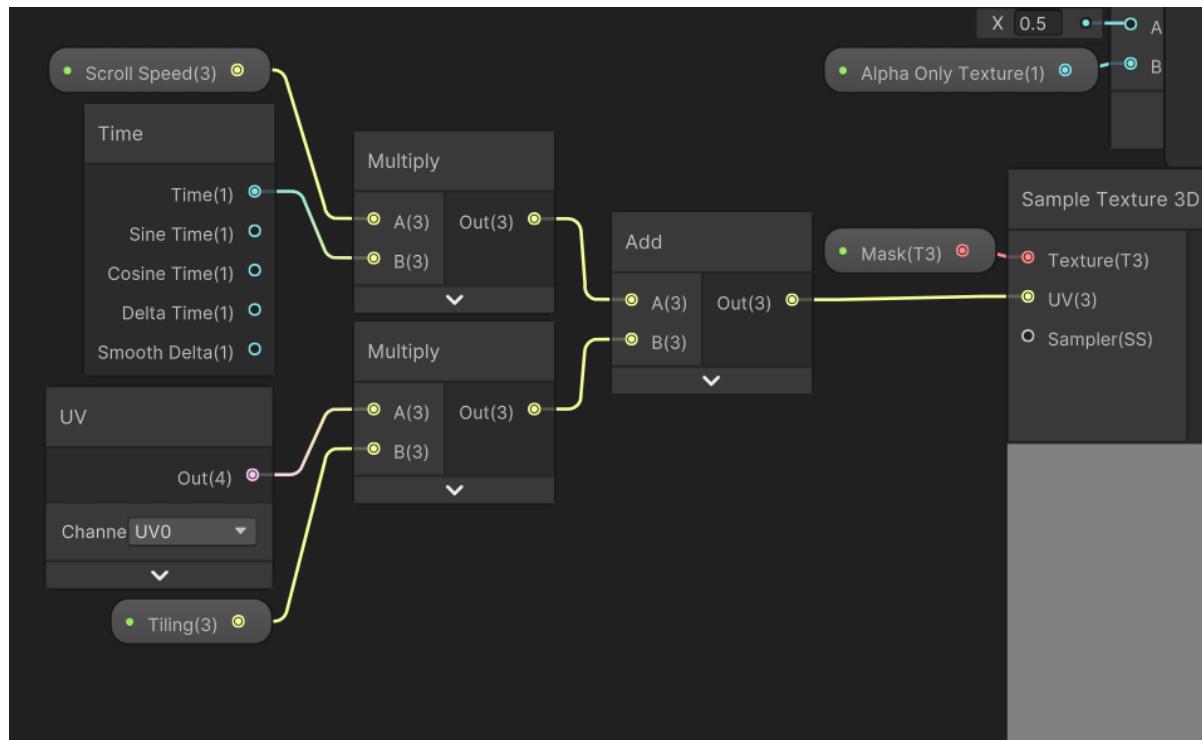

```

1 FragInputs BuildFragInputs(VertexToFragment v2f, float3 voxelPositionOS,
float3 voxelClipSpace)
2 {
3     FragInputs output;
4     ZERO_INITIALIZE(FragInputs, output);
5
6     float3 positionWS = mul(UNITY_MATRIX_M, float4(voxelPositionOS, 1)).xyz;
7     output.positionSS = v2f.positionCS;
8     output.positionRWS = output.positionPredisplacementRWS = positionWS;
9     output.positionPixel = uint2(v2f.positionCS.xy);
10    output.texCoord0 = float4(saturate(voxelClipSpace * 0.5 + 0.5), 0);
11    output.tangentToWorld = k_identity3x3;

```

```
12  
13     return output;  
14 }
```

以下代码为计算UV

MaterialMask (TODO)

Volumetric Lighting

着色部分主要有两个步骤：

1. 体积光照
2. 过滤 (可选)

VolumetricLighting

```
1 | Runtime/Lighting/volumetricLighting/volumetricLighting.compute
```

下图是 VolumetricLighting Kernel的核心代码片段，对于构造Ray以及计算导数部分，代码跟之前第一个Pass是一样的

```
1 #ifdef ENABLE_REPROJECTION
2     float2 sampleOffset = _vBufferSampleOffset.xy;
3 #else
4     float2 sampleOffset = 0;
5 #endif
6     // 重投影后的光线方向
7     ray.jitterDirWS = normalize(ray.centerDirWS + sampleOffset.x *
8                                 ray.xDirDerivWS
9                                 + sampleOffset.y *
10                                ray.yDirDerivWS);
11    // dot(ray.jitterDirWS, F) 为 cosine
12    // cosine = Near / sStart,
13    // sStart = Near / cosine;
14    // NOTE: F是单位矩阵
15    /*          Near
16      . .
17      . . p
18      . . theta
19      0 -----> forward
```

```

20
21
22
23
24
25     cos(theta) = dot(normalize(op), forward) ; ps: forward 都为单位向量
26     cos(theta) = near / length(op);
27 */
28 float tStart = g_fNearPlane / dot(ray.jitterDirws, F);
29
30 // we would like to determine the screen pixel (at the full resolution)
31 which
32 // the jittered ray corresponds to. The exact solution can be obtained
33 by intersecting
34 // the ray with the screen plane, e.i. (ViewSpace(jitterDirws).z = 1).
35 That's a little expensive.
36 // So, as an approximation, we ignore the curvature of the frustum.
37 // 计算对应的全屏幕坐标
38 uint2 pixelCoord = (uint2)((voxelCoord + 0.5 + sampleOffset) *
39 _VBufferVoxelsize);
40
41 #ifdef VL_PRESET_OPTIMAL
42 // The entire thread group is within the same light tile.
43 // 正好每个线程组负责一条射线，且slice为8
44 uint2 tileCoord = groupOffset * VBUFFER_VOXEL_SIZE / TILE_SIZE_BIG_TILE;
45 #else
46 // No compile-time optimizations, no scalarization.
47 // 计算出tile的坐标
48 uint2 tileCoord = pixelCoord / TILE_SIZE_BIG_TILE;
49#endif
50 // 计算出Grid的Index
51 uint tileIndex = tileCoord.x + _NumTileBigTilex * tileCoord.y;
52 // This clamp is important as _VBufferVoxelsize can have float value
53 // which can cause en overflow (Crash on Vulkan and Metal)
54 tileIndex = min(tileIndex, _NumTileBigTilex * _NumTileBigTileY);
55
56 // Do not jitter 'voxelCoord' else. It's expected to correspond to the
57 // center of the voxel.
58 // 此方法注释见下
59 PositionInputs posInput = GetPositionInput(voxelCoord,
60 _VBufferViewportSize.zw, tileCoord);
61
62 ray.geomDist = FLT_INF;
63 ray.maxDist = FLT_INF;
64 #if USE_DEPTH_BUFFER
65 // 采样_CameraDepthTexture
66 float deviceDepth = LoadCameraDepth(pixelCoord);
67
68 if (deviceDepth > 0) // skip the skybox
69 {
70     // Convert it to distance along the ray. Doesn't work with tilt
71 shift, etc.
72     // 转成线性深度 [Near, Far]
73     float linearDepth = LinearEyeDepth(deviceDepth, _ZBufferParams);
74     // 同样的余弦定理应用计算出到光到几何体的线性距离
75     // 详情见下图

```

```

68     ray.geomDist = linearDepth * rcp(dot(ray.jitterDirWS, F));
69
70     float2 uv = posInput.positionNDC * _RTHandlescale.xy;
71
72     // This should really be using a max sampler here. This is a bit
73     // overdilating given that it is already dilated.
74     // Better to be safer though.
75     float4 d = GATHER_RED_TEXTURE2D_X(_MaxZMaskTexture,
76     s_point_clamp_sampler, UV) * rcp(dot(ray.jitterDirWS, F));
77     ray.maxDist = max(Max3(d.x, d.y, d.z), d.w);
78 }
79 #endif
80
81 // TODO
82 LightLoopContext context;
83 context.shadowContext = InitShadowContext();
84 uint featureFlags = 0xFFFFFFFF;
85
86 ApplyCameraRelativeXR(ray.originWS);
87
88 FillVolumetricLightingBuffer(context, featureFlags, posInput, tileIndex,
89 groupIndex, ray, tStart);

```

下图是计算geomDist的示意图

下图是进行重投影的Offset选择规则示意图，总共7个采样点，分7帧进行，每一帧选择1个采样点。

下面是填充LightingBuffer的核心代码

1. 数据准备部分：准备灯光数据

```
1 // Computes the in-scattered radiance along the ray.
2 void FillVolumetricLightingBuffer(LightLoopContext context, uint
3 featureFlags,
4                                     PositionInputs posInput, uint tileIndex,
5                                     int groupIdx, JitteredRay ray, float tStart)
6 {
7     uint lightCount, lightStart;
8
9 #ifdef USE_BIG_TILE_LIGHTLIST
10    // offset for stereo rendering
11    tileIndex += unity_StereoEyeIndex * _NumTileBigTlx * _NumTileBigTly;
12
13    // The "big tile" list contains the number of objects contained within
14    // the tile followed by the
15    // list of object indices. Note that while objects are already sorted by
16    // type, we don't know the
17    // number of each type of objects (e.g. lights), so we should remember
18    // to break out of the loop.
19    lightCount = g_vBigTileLightList[MAX_NR_BIG_TILE_LIGHTS_PLUS_ONE *
20                                     tileIndex];
21
22    // On Metal for unknow reasons it seems we have bad value sometimes
23    // causing freeze / crash. This min here prevent it.
24    lightCount = min(lightCount, MAX_NR_BIG_TILE_LIGHTS_PLUS_ONE);
25    lightStart = MAX_NR_BIG_TILE_LIGHTS_PLUS_ONE * tileIndex + 1;
26
27    // For now, iterate through all the objects to determine the correct
28    // range.
29    // TODO: precompute this, of course.
30    {
31        uint offset = 0;
32
33        int validLightCount = 0;
34
35        for (; offset < lightCount; offset++)
36        {
37            uint objectIndex = FetchIndex(lightStart, offset);
38
39 #if PRE_FILTER_LIGHT_LIST
```

```

30         LightData light = _LightDatas[objectIndex];
31         if (light.volumetricLightDimmer > 0 && validLightCount <
32             MAX_SUPPORTED_LIGHTS && objectIndex < _EnvLightIndexShift)
33         {
34             // 提前按group进行index的存储
35             gs_localLightList[groupIdx][validLightCount++] =
36             objectIndex;
37         }
38     #else
39         validLightCount++;
40     #endif
41         if (objectIndex >= _EnvLightIndexShift)
42         {
43             // we have found the last local analytical light.
44             break;
45         }
46     }
47 }
48
49 #else // USE_BIG_TILE_LIGHTLIST
50
51     lightCount = _PunctualLightCount;
52     lightStart = 0;
53
54 #endif // USE_BIG_TILE_LIGHTLIST
55

```

2. 采样环境光

```

1 // 获取起点t和每一次步进的深度
2     float t0 = max(tStart, DecodeLogarithmicDepthGeneralized(0,
3     _VBufferDistanceDecodingParams));
4     float de = _VBufferRcpSliceCount; // Log-encoded distance between slices
5
6     // The contribution of the ambient probe does not depend on the
7     // position,
8     // only on the direction and the length of the interval.
9     // SamplesH9() evaluates the 3-band SH in a given direction.
10    // The probe is already pre-convolved with the phase function.
11    // Note: anisotropic, no jittering.
12    // 对环境光进行球谐采样
13    float3 probeInScatteredRadiance =
        EvaluateVolumetricAmbientProbe(ray.centerDirws);
14
15

```

3. 根据slice进行步进，同时确定抖动offset

```

1   float3 totalRadiance = 0;
2   float opticalDepth = 0;
3   uint slice = 0;
4   for (; slice < _vBuffersSliceCount; slice++)
5   { // positionSS 就是 voxelCoord
6       uint3 voxelCoord = uint3(posInput.positionSS, slice +
7       _vBuffersSliceCount * unity_StereoEyeIndex);
8
9       float e1 = slice * de + de; // (slice + 1) / sliceCount
10      // 当前的起点
11      float t1 = max(tStart, DecodeLogarithmicDepthGeneralized(e1,
12      _vBufferDistanceDecodingParams));
13      float tNext = t1;
14
15      #if USE_DEPTH_BUFFER
16          bool containsOpaqueGeometry = IsInRange(ray.geomDist, float2(t0,
17          t1));
18          // 如果射线穿透了opaque物体，则需要对t1做修正
19          if (containsOpaqueGeometry)
20          {
21              // Only integrate up to the opaque surface (make the voxel
22              // shorter, but not completely flat).
23              // Note that we can NOT completely stop integrating when the
24              // ray reaches geometry, since
25              // otherwise we get flickering at geometric discontinuities if
26              // reprojection is enabled.
27              // In this case, a temporally stable light leak is better than
28              // flickering.
29              // 对t1进行修正，详见下图
30              t1 = max(t0 * 1.0001, ray.geomDist);
31          }
32      #endif
33      float dt = t1 - t0; // Is geometry-aware
34      if(dt <= 0.0) // 积分微元非正数，则无需积分
35      {
36          _vBufferLighting[voxelCoord] = 0;
37      #ifdef ENABLE_REPROJECTION
38          _vBufferFeedback[voxelCoord] = 0;
39      #endif
40          t0 = t1;
41          continue;
42      }

```

```

36
37     // Accurately compute the center of the voxel in the log space.
38     // It's important to perform
39     // the inversion exactly, since the accumulated value of the
40     // integral is stored at the center.
41     // we will use it for participating media sampling, asymmetric
42     // scattering and reprojection.
43     // 求出当前slice中心点的t

125 }
126 } // end of loop
127

```

下图是对t1进行修正的示意图

4.光的着色

下面是着色部分的代码，主要分为平行光，局部光，全局光照三部分

```

1  if (featureFlags & LIGHTFEATUREFLAGS_DIRECTIONAL)
2  {
3      // 这里计算平行光的着色结果
4      VoxelLighting lighting =
5      EvaluateVoxelLightingDirectional(context, featureFlags, posInput,
6      centerWS, ray, t0, t1, dt, rndval,
7      extinction, anisotropy);
8
9      aggregateLighting.radianceNoPhase += lighting.radianceNoPhase;
10     aggregateLighting.radianceComplete += lighting.radianceComplete;
11 }
12
13 #ifdef SUPPORT_LOCAL_LIGHTS
14 { // 这里计算局部光（点光，聚光...）的着色结果
15     VoxelLighting lighting = EvaluateVoxelLightingLocal(context,
16     groupIdx, featureFlags, posInput,
17                                         lightCount,
18     lightStart,
19                                         centerWS,
20     ray, t0, t1, dt, rndval,
21                                         extinction,
22     anisotropy);
23
24     aggregateLighting.radianceNoPhase += lighting.radianceNoPhase;
25     aggregateLighting.radianceComplete += lighting.radianceComplete;
26 }
27 #endif

```

```

23
24     #if SAMPLE_PROBE_VOLUMES
25     {
26         // 计算低频的全局光照
27         float3 apvDiffuseGI = EvaluateVoxelDiffuseGI(posInput, ray, t0,
28             dt, rndVal, extinction);
29         aggregateLighting.radianceNoPhase += apvDiffuseGI;
30         aggregateLighting.radianceComplete += apvDiffuseGI;
31     }
32 #endif
33

```

4.重投影

下面的代码主要是做重投影，以及着色结果的合并

重投影时从 **VBufferHistory** 读取上一帧数据，

并且把这一帧结果写进 **VBufferFeedback**.

在HDCamera会创建一个双buffer用于重投影

```

1 internal RTHandle[] volumetricHistoryBuffers; // Double-buffered; only used
for reprojection
2

```

```

if (passData.enableReprojection)
{
    passData.feedbackBuffer = builder.WriteTexture(input: renderGraph.ImportTexture(hdCamera.volumetricHistoryBuffers[currIdx]));
    passData.historyBuffer = builder.ReadTexture(input: renderGraph.ImportTexture(hdCamera.volumetricHistoryBuffers[prevIdx]));
}

```

其中feedbackBuffer用于存当前帧的结果

对于历史帧的混合计算如下

```

1 float numFrames      = 7;
2 float frameWeight   = 1 / numFrames;
3 float historyWeight = 1 - frameWeight;
4
5 return historyWeight;

```

```

1 // Perform temporal blending in the log space ("Pixar blend").
2 normalizedBlendValue = lerp(normalizedVoxelValue, reprojValue,
ComputeHistoryWeight());

```

以下代码为重投影的计算过程

```

1 #ifdef ENABLE_REPROJECTION
2     // Clamp here to prevent generation of NaNs.
3     float4 voxelValue          = float4(aggregateLighting.radianceNoPhase,
4         extinction * dt);
4     float4 linearizedVoxelValue = LinearizeRGBD(voxelValue);

```

```

5 // 进行单位化，可以确保不会受不同长度dt的影响
6 float4 normalizedVoxelValue = linearizedVoxelValue * rcp(dt);
7 float4 normalizedBlendValue = normalizedVoxelValue;
8
9 #if (SHADEROPTIONS_CAMERA_RELATIVE_RENDERING != 0) &&
defined(USING_STEREO_MATRICES)
10 // with XR single-pass, remove the camera-relative offset for the
reprojected sample
11 centerWS -= _WorldSpaceCameraPosViewOffset;
12 #endif
13
14 // Reproject the history at 'centerws'.
15 float4 reprojValue = SampleVBuffer(TEXTURE3D_ARGS(_VBufferHistory,

51     phaseCurrFrame.b = SafeDiv(aggregateLighting.radianceComplete.b,
aggregateLighting.radianceNoPhase.b);
52
53     // Warning: in general, this does not work!
54     // For a voxel with a single light, 'phaseCurrFrame' is monochromatic,
and since
55     // we don't jitter anisotropy, its value does not change from frame to
frame
56     // for a static camera/scene. This is fine.
57     // If you have two lights per voxel, we compute:
58     // phaseCurrFrame = (phaseA * lightingA + phaseB * lightingB) /
(lightingA + lightingB).
59     // 'phaseA' and 'phaseB' are still (different) constants for a static
camera/scene.
60     // 'lightingA' and 'lightingB' are jittered, so they change from frame
to frame.
61     // Therefore, 'phaseCurrFrame' becomes temporarily unstable and can
cause flickering in practice. :-(

62     blendvalue.rgb *= phaseCurrFrame;
63 #endif // ENABLE_ANISOTROPY

64

65 #else // NO REPROJECTION

66

67 #ifdef ENABLE_ANISOTROPY

72

73 #endif // ENABLE_REPROJECTION

74

75     // Compute the transmittance from the camera to 't0'.
76     // 这里的计算依据Beer-Lambert定律
77     float transmittance = TransmittanceFromOpticalDepth(opticalDepth);

78

79 #ifdef ENABLE_ANISOTROPY
80     float phase = _CornetteShanksConstant;
81 #else
82     float phase = IsotropicPhaseFunction();
83 #endif // ENABLE_ANISOTROPY

84

85     // Integrate the contribution of the probe over the interval.
86     // Integral{a, b}{Transmittance(0, t) * L_s(t) dt} = Transmittance(0,
a) * Integral{a, b}{Transmittance(0, t - a) * L_s(t) dt}.
87     float3 probeRadiance = probeInScatteredRadiance *
TransmittanceIntegralHomogeneousMedium(extinction, dt);

88

89     // Accumulate radiance along the ray.
90     // blendvalue前面已经乘了一次cs相函数非常数项的部分, 这里phase是常数项部分

```

```

91     totalRadiance += transmittance * scattering * (phase * blendValue.rgb +
    probeRadiance);

```

HDRP相位函数分析

在HDRP中，采用的CS模型的相函数，主要拆分为了三个部分：

1.常量部分

```

real CornetteShanksPhasePartConstant(real anisotropy)
{
    real g = anisotropy;

    return (3 / (8 * PI)) * (1 - g * g) / (2 + g * g);
}

```

Draine's phase function is a two-parameter distribution

$$\phi_{\alpha,g}(\theta) = \frac{1}{4\pi} \frac{1-g^2}{(1+g^2-2g\cos\theta)^{3/2}} \frac{1+\alpha\cos^2\theta}{1+\alpha(1+2g^2)/3} \quad (2)$$

and reduces to HG for $\alpha=0$, to Rayleigh for $g=0$, $\alpha=1$ and to CS for $\alpha=1$.

$$P_{CS}(\phi) = \frac{3}{2} \frac{(1-g^2)}{(2+g^2)} \frac{(1+\cos^2\theta)}{(1+g^2-2g\cos\theta)^{3/2}}$$

参考：<https://research.nvidia.com/labs/rtr/approximate-mie/publications/approximate-mie.pdf>

HDRP上面公式中常数项多乘了 $1/4\pi$ ，可能是考虑到了均匀介质下，对于每个单位立体角散射的概率就是 $1/4\pi$ 。

2.变量部分

```

real CornetteShanksPhasePartVarying(real anisotropy, real cosTheta)
{
    return CornetteShanksPhasePartSymmetrical(cosTheta) *
           CornetteShanksPhasePartAsymmetrical(anisotropy, cosTheta); // h * x^(-3/2)
}

```

在公式的变量部分，又拆分成了**各向同性**和**各向异性**两部分。

2.1 各项同性

```

real CornetteShanksPhasePartSymmetrical(real cosTheta)
{
    real h = 1 + cosTheta * cosTheta;
    return h;
}

```

$$P_{CS}(\phi) = \frac{3}{2} \frac{(1-g^2)}{(2+g^2)} \frac{(1+\cos^2\theta)}{(1+g^2-2g\cos\theta)^{3/2}}$$

2.2 各向异性

```

real CornetteShanksPhasePartAsymmetrical(real anisotropy, real cosTheta)
{
    real g = anisotropy;
    real x = 1 + g * g - 2 * g * cosTheta;
    real f = rsqrt(max(x, REAL_EPS)); // x^(-1/2)
    return f * f * f; // x^(-3/2)
}

```

$$P_{CS}(\phi) = \frac{3}{2} \frac{(1-g^2)}{(2+g^2)} \frac{(1+\cos^2\theta)}{(1+g^2-2g\cos\theta)^{3/2}}$$

光的着色

以下代码是对平行光内散射的积分计算

```

115                         lighting.radianceComplete += (weight * lightColor.rgb) * phase;
116                     }
117                 }
118
119             return lighting;
120         }

```

```

// Samples the interval of homogeneous participating medium using the closed-form tracking approach
// (proportionally to the transmittance).
// Returns the offset from the start of the interval and the weight = (transmittance / pdf).
// Ref: Monte Carlo Methods for Volumetric Light Transport Simulation, p. 5.
void ImportanceSampleHomogeneousMedium(real rndVal, real extinction, real intervalLength,
                                         out real offset, out real weight)
{
    // pdf = extinction * exp(extinction * (intervalLength - t)) / (exp(intervalLength * extinction) - 1)
    // pdf = extinction * exp(-extinction * t) / (1 - exp(-extinction * intervalLength))
    // weight = TransmittanceFromOpticalDepth(t) / pdf
    // weight = exp(-extinction * t) / pdf
    // weight = (1 - exp(-extinction * intervalLength)) / extinction
    // weight = OpacityFromOpticalDepth(extinction * intervalLength) / extinction

    real x = 1 - exp(-extinction * intervalLength);
    real c = rcp(extinction);

    // TODO: return 'rcpPdf' to support imperfect importance sampling...
    weight = x * c;
    offset = -log(1 - rndVal * x) * c;
}

```

关于采样权重的计算，综合考虑了总衰减值和Beer-Lambert定律。

x 为 $1-\text{EXP}(-\text{extinction} * \text{intervalLength})$, 根据Beer-Lambert, 越厚的物体透光率越差, 这里算出经过intervalLength厚的介质后, 剩余的比例

c : 衰减值extinction的倒数, 也就是衰减距离, 对于衰减距离越短的, 对应的权重也比较小。

分析 (TODO)

1. 性能分析
2. 优缺点分析以及如何落地项目

问题汇总

1. 为什么用投影矩阵的宽高比而不是直接用相机的宽高比?
2. 第一个Pass的变换矩阵推导?
3. 体素化时, “Sphere-capped”如何理解?
4. 实际着色时, 代码中使用的公式只有变量部分, 为什么? 因为最近结果计算时会把常数部分也一起算进去
5. 重投影会有严重闪烁问题。
